

DIOLITE™ 532

Pre-Treatment Information

1. Generally little or no pre-treatment is required with the DioLite™ 532.
2. Your physician may recommend a treatment to prepare you for laser therapy. Sometimes a mild bleaching agent is prescribed to lighten the areas that will be treated.

Post-Treatment Instructions

1. The area treated with the laser may be red afterward. This will generally fade within 24-48 hours.
2. The treated area can be washed normally with mild soap and water. Wash the area gently with your fingertips. Avoid using a washcloth, loofa or anything else abrasive on the affected area.
3. For the next 3-4 weeks, avoid sun exposure to the treated area. Use of a sunscreen containing an SPF of 15 or higher is recommended.
4. Avoid irritants such as products containing glycolic acid or Retin-A for 5-7 days.
5. Minor crusting or scabbing of the treated area can occur. Do not rub or pick the scab. After washing with fingertips with a gentle soap, apply an antibacterial ointment or healing ointment to the treated area.
6. Pigmented lesions may turn gray or dark after treatment. As the skin heals, in 7-14 days, the spot will slough off. Do not rub or pick the lesion. Antibacterial or moisturizing ointment may be applied to the area as desired.

Please remember that multiple treatments may be required to achieve the optimum result with either vascular or pigmented lesions.
